Abstract

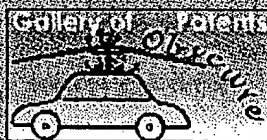

Solid calcium lactate is produced through the processes of separation in a calcium lactate solution container with a sandwiched drum, which has cooling medium led to the sandwich and scraper on one side and over one collector; heating calcium lactate solution to a 30-85% solid content before added to the container under the drum; cooling the drum with cooling water, rotating it to produce solid calcium lactate layer on the surface of the drum and scraping solid calcium lactate down to the collector; and stoving solid calcium lactate in a stove.
